Test Name	Result	Biological Ref. Interval	Unit
18	Sunflower	< 0.35	Ku/L
19	Timothy Grass	< 0.35	Ku/L
20	Trichophyton Mentagrophytes	< 0.35	Ku/L

**Interpretation:**

Class	Concentration (kU/l)	Result
0	<0.35	No Specific Antibodies Detected
1	$0.35 \leq \text{slgE} < 0.7$	Very Low antibody Titer, Frequently no clinical symptoms where sensitisation is present
2	$0.7 \leq \text{slgE} < 3.5$	Low Antibody Titer, existing sensitisation, frequently with clinical symptoms in the upper range of class
3	$3.5 \leq \text{slgE} < 17.5$	Significant antibody titer, clinical symptoms usually present
4	$17.5 \leq \text{slgE} < 50.0$	High antibody titer, almost always with clinical symptoms
5	> 50.0	Very High Antibody Titer

1. Total IgE is represents the sum of all the specific IgE, which inturn includes many groups of specific IgE & allergen specific IgE is just one such group amongst them.
2. Total IgE determination constitutes a screening method of atopic diseases, although within range values of total IgE do not exclude the existence of atopy and high values of total IgE are not pathognomonic of atopy by themselves.
3. Antigen-specific IgE is the next step in the in vitro identification of the responsible allergen. There are more than 400 characterized known allergens available for in vitro diagnostic tests and testing to be selected based on symptoms, clinical & environmental details.
4. In adults, Total IgE values between 100 to 1000 UI/ml may not correlate with allergen specific IgE, where the patients may be just sensitized to different allergen or often the cause for high IgE could be non-atopic.
5. Specific IgE results obtained with the different methods vary significantly, hence followup testing to be performed using one laboratory only.
6. A general model for interpretation of IgE antibody levels in relation to clinical symptoms and should also be correlated with following factor. Age, Type of sensitizing allergens, Degree of atopy, Previous symptoms, Allergen Load, Other triggering factors.
